                                 This invention describes a novel protein (I) with splice-factor activity in plants (I) modifies the choice of splice sites in many plant pre-mRNAs. (I) (also the nucleic acid that encodes them and related vectors or expression systems) are used: (i) to alter splice patterns in plants, or their parts; (ii) to alter developmental behavior of plants; and/or (iii) to delay flowering, particularly by at least 25% relative to the wild type, especially in crop plants such as cereals, beans, rice
                                                                                                                                                                                                                     9

                                                                                                                                                                                                                                                                           This invention describes a novel protein (I) with splice-factor activity in plants (I) modifies the choice of splice sites in many plant pre-mRNAs. (I) (also the nucleic acid that encodes them and related vectors or expression systems) are used: (i) to alter splice patterns in plants, or their parts; (ii) to alter developmental behavior of plants; and/or (iii) to delay flowering, particularly by at least 25% relative to the wild type, especially in crop plants such as cereals, beans, rice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel protein (I) with splice-factor activity in plants (I) modifies the choice of splice sites in many plant pre-mRNAs. (I) (also the nucleic acid that encodes them and related vectors or expression systems) are used: (i) to alter splice patterns in plants, or their parts; (ii) to alter developmental behavior of plants; and/or (iii) to delay flowering, particularly by at least 25% relative to the wild type, especially in crop plants such as cereals, beans, rice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MSSRWNRTIYVGNLPGDIRKCEVEDLFYKYGPIVDIDLKIPPRPPGYAFVEFEDPRDADD 60

(I) (also the nucleic acid that encodes them and related vectors or expression systems) are used: (i) to alter splice patterns in plants, or their parts; (ii) to alter developmental behavior of plants; and/or (iii) to delay flowering, particularly by at least 25% relative to the wild type, especially in crop plants such as cereals, beans, rice
                                                                                                                                                                   09

"Isolation of full-length cDNA clones from mouse brain cDNA library made by oligo-capping method.";

Submitted (APR-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: A PROBABLE ROLE IN ALTERNATIVE SPLICE SITE SELECTION DIRING PRE-MRNA SPLICE (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear (By similarity).

-!- PTM: EXTENSIVELY PHOSPHORYLATED ON SERINE RESIDUES IN THE RS DOMAIN (By similarity).

-!- STELLIARITY: Contains 2 RNA recognition motif (RRM) domains.

-!- SIMILARITY: BELONGS TO THE SR FAMILY OF SPLICING FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EMBL; BC019437; AAH19437.1; -..

"Alternative splicing and structure of the human and mouse
SFRSS/HRS/SRp40 genes.";
Gene 204:243-249[1937].
-!- FUNCTION: MAY BE REQUIRED FOR PROGRESSION THROUGH G1 AND ENTRY
INTO S PHASE OF CELL GROWTH. MAY PLAY A REGULATORY ROLE IN PRE-
MRNA SPLICING, AUTOREGULATES ITS OWN EXPRESSION. PLAYS A ROLE IN
CONSTITUTIVE SPLICING AND CAN MODULATE THE SELECTION OF
ALTERNATIVE SPLICE SITES (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: NUClear (Poctential).
-!- FTM: EXTENSIVELY PHOSPHORYLATED ON SERINE RESIDUES IN THE RS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

--- FUNCTION. REQUIRED FOR PRE-MMRA SPLICING. CAN ALSO MODULATE

ALTERNATIVE SPLICING IN VITTRO.

--- SUBCELLULAR IOCATION: Nuclear.

--- ALTERNATIVE PRODUCTS:

--- Gromment=Isoforms, often lacking the RS domain and differentially C.C.

--- Gromment=Isoforms, often lacking the RS domain and differentially C.C.

--- Function in fetal tissues, may be involved in modulation of 998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: Has a role in pre-mRNA splicing where it is involved spliceosome assembly (By similarity).

SUBCELLULAR LOCATION: Nuclear (Potential).

PTM: Extensively phosphorylated on serine residues in the RS domain (By similarity).

SIMILARITY: Contains 2 RNA recognition motif (RRM) domains.

SIMILARITY: BELONGS TO THE SR FAMILY OF SPLICING FACTORS.
                                                                                                                                                           Nucleic Acids Res. 26:505-511(1998)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=98162722; PubMed=9501991;

; Sequence 12, Application US/07881075
; Patent No. 5444149
; GENERAL INFORMATION:
    APPLICANT: KENEY. JACK D.
    APPLICANT: KING, PETER H.
    APPLICANT: LEVINE, TODD
    TITLE OF INVENTION: METHODS AND COMPOSITIONS USEFUL IN THE TITLE OF INVENTION: RECOGNITION, BINDING AND EXPRESSION OF RIBONUCLEIC ACIDS
    TITLE OF INVENTION: NOULVED IN CELL GROWTH, NEOPLASIA AND IMMUNOREGULATION NUMBER OF SEQUENCES: 51
    CORRESPONDENCE ADDRESS:
    ADDRESSEE: D.C.
    STREET: 1755 Jefferson Davis Highway, Fourth Floor
    CITY: Antington STATE: Virginia
    COUNTRY: U.S.A.
    COUNTRY: U.S.A.
